

Schertler Bluestick

Now Available As RetroFit

Designed for the acoustic guitarist with existing on-board preamplifier controls, the Bluestick RetroFit simply replaces the existing piezo pickup. The player gets the great sound of the Bluestick while maintaining the functionality of the existing preamp. The Schertler Bluestick is a unique patented active transducer that sits under the guitar's saddle to accurately reproduce the sound of the instrument instead of merely recreating it via imprecise piezo-

ceramic mechanics. One-thousandth the weight of a piezo, the Bluestick provides a richer, more complex sound without the 'mid-range suck-out' that plagues piezo pickups. With simple non-invasive installation, just one small hole needs to be drilled under the guitar's saddle. Bluestick RetroFit requires no visual modification of your instrument – no more unsightly control panels. The Bluestick RetroFit is available for any

acoustic guitar, from classic to western, nylon or steel string, as well as 12-string and acoustic bass guitar. SRP £155
